                         alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus.
                                                                                                                                                                                                    Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquatious DNA polymerase, Thermus thermophilus DNA
                                                                                                                                                                                                                                                                                                         Cleavage of nucleic acids to detect mutation(s) - allows detection esp. in human p53 gene, to identify strains of microorganisms and viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             p53; mutant; mutation; cleavage; nuclease;

                                                                                                                                                                                                                     Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coll ExoIII and the Saccharcomyces cerevisiae Radl/Radl0 complex. The nucleic acid substrate is preferably an oligonucleotide containing a human p53 gene sequence or
                                                                                                         alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    alignment_block:
US-08-860-232-1 x T27663
                      Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli ExoIII and the Saccharomyces cerevisiae Radl/Radl0 complex. The nucleic acid substrate is preferably an oligonucleotide containing a human p53 gene sequence or alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Align seg 1/1 to: T27663

                                                                                                                                                                                                                                             An EcoRI-Sall DNA fragment (T32836) of plasmid pgEMhump53wt comprises a coding sequence (see also T32831) for human wild-type tumour suppressor p53 (W02617) but incorporates a kpnI site at codon 218, SstI site at codon 299, SstII at codon 333, BstBI at codon 38 and Sall immediately following the termination codon. These sites were incorporated by PCR to expedite construction of DNA sequences coding for p53 proteins bearing altered tetramerizations or point mutations for use in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                       New chimaeric p53 protein with heterologous tetramerisation doma - and related DNA and vectors, useful for treating abnormal cell proliferation, esp. cancer, auto-immune disease, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     p53 protein; tumour suppressor; tetramerisation domain; chimaeric protein; gene therapy; vector; cell proliferation; apoptosis; autoimmune disease; immune tolerance; pGEMhump53;

Sequence 1242
                      mammalian cells but are capable of extended stable expression of the target sequence, generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the other components of the vectors. The vectors are particularly useful in accommodating monomorphic and polymorphic nucleic acid sequences encoding tumor antigens via PCR technology.
                                                                                                                          This sequence comprises human p53 cDNA. Primers (see V21728-29) from p53 cDNA can be used to target p53 sequences into novel humanised polynucleotide vectors such as plasmid pITL (see V21724). These humanised vectors comprise a human-derived promoter (or mammalian homologue) which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The vectors are non-replicating in
                                                                                                                                                                                                                                                                         Humanised polynucleotide vectors - and sequence acceptance site, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100 CTACTTCCTGAAAACAACGTTCTGTCCCCCTTG 132

                                         Percent Similarity:
                                                                                                                                                                 The present sequence encodes a human p53 protein. The protein is used in the assay of the invention. The specification describes an assay method for a compound able to modulate the interaction between ATM or a protein having an associated kinase activity and p53 or a protein having homologous phosphorylation sites. The assay comprises contacting a peptide fragment ATM with a relevant fragment of p53 and a test compound, and determining the interaction or binding between the substances and the test compound. The assay method is useful for screening for compounds able to modulate the interaction between ATM and p53. The screened agents, peptide fragments and nucleic acids are useful for therapy involving modulating ATM action e.g. in the treatment of cancer, immunosuppression or HIV infections by modulating phosphorylation of p53 by ATM, and for purifying the proteins
                                                                                                                                                                                                                                                                                                                                                                                                Assay method for compounds modulating the interaction of ATM and useful for the treatment of e.g. cancer, immunosuppression and infections and for the purification of the proteins ATM and ATR

                                                                                                                                                   The patent discloses a method for the treatment of systemic lupus erythematosus (SLE) by down-regulating the autoimmune response to the C-terminal DNA-binding domain of p53 protein by an active compound comprising C-terminal DNA-binding domain of p53, monoclonal antibodies (Ab1) specific to this domain, monoclonal antibodies (Ab2) specific to Ab1 and peptides based on the complementarity determining region of heavy and light chain of Ab1 and Ab2. The active compound is useful in the diagnosis, prevention and treatment of SLE in humans. The present sequence is a human tumour-associated antigen p53 DNA. Antibodies against the C-terminal DNA-binding domain of the p53 DNA.

                                                        secreted proteins. The extended cDNAs (or genomic DNAs obtainable from CC them) may be used to prepare PCR primers and probes. These are useful for forensic matching or positive identification by DNA sequencing. They may calso be used in alternative fingerprint identification techniques. CC Antibodies against the proteins encoded by the extended cDNAs are useful in identification of tissue types or cell species, as well as identifying tissue specific soluble proteins. The sequences can be used for construction of secretion vectors. Other sequences derived with hereditary construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of secretion vectors. Other sequences derived from the construction of the proteins may be useful in construction and treating several disorders including, but not limited to: cancer, hyperlipidaemia, cardiovascular and neurodegenerative disorders, but not proteins and the construction of the proteins are constructed by the const
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             autoimmune disease; rheumatic disease; embryogenic disorder; myopathy; renal injury; amino aciduria; hypoglycaemia; male rat infertilitv: hypertension: ss

                                                                                                                            This invention describes novel nucleic acid sequences of extended cDNAs (see 897813-897906) which encode human secreted proteins (see Y36129-Y36222) and which have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Wes also include design of expression vectors and secretion vectors. This sequence represents an oligoribonucleotide primer used in the method of the invention.

                                                                               This sequence represents an oligonucleotide used to isolate the extended human secreted protein coding sequences of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to seconstructing a high resolution map of the human chromosomes. They can

                                                                                                                                                                                                                                                                                        X X40251 to X40397 represent 5' expressed sequence tags (ESTs) for human CC secreted proteins, and encode the proteins given in X11533 to X11679, CC respectively. The proteins given represent the signal peptide and an CC N-terminal fragment of a secreted protein. The nucleic acid sequences CC can be used for producing secreted human gene products. They can also CC obtained may have cytokine activity, cell proliferation/differentiation CC activity, haematopoiesis regulating activity, tissue growth regulating CC activity, reproductive hormone regulating activity, chemotactic/ CC ligand activity, anti-inflammatory activity, tumour inhibition activity or other activity, anti-inflammatory activity, tumour inhibition activity or other activity. The products can be used in forensic, gene therapy CC and chromosome mapping procedures. The sequences can also be used for CC the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or CC importing a polypeptide into a cell. The present sequence represents an coligoribonucleotide used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq_name: /SIDS6/gcgdata/geneseq/geneseqn/NA1999.DAT:X19963

                                                  x51459 to x51691 represent 5' expressed sequence tags (ESTs) for human considerable proteins, and encode the proteins given in Y12681 to Y12913, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, naematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haemostatic and thromobytic activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activity, anti-inflammatory activity, tumour inhibition activity and chromosome mapping procedures. The sequences can also be used for obtaining corresponding procedures. The sequences can also be used for the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell. This sequence represents an objective cap, used in the isolation of the 5' EST sequences of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Align seg 1/1 to: X19963

                           CC v11374-v11531. The proteins given represent the signal peptide and an CC N-terminal fragment of a secreted protein. The nucleic acid sequences CC can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and thorapy. The proteins CC obtained may have cytokine activity, cell proliferation/differentiation CC activity, haematopoiesis regulating activity, tissue growth regulating CC chemokinetic activity, haemostatic and thrombolytic activity, receptor/ CC ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy CC and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding CC the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. This sequence represents an colliporibonucleotide which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq_name: /SIDS6/gcgdata/geneseq/geneseqn/NA1999.DAT:X39410

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Percent Similarity:
             secreted proteins expressed in prostate, and encode the proteins given in Y11716 to Y1193 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation and differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity. chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; secreted protein; EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; prostate; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition; ss.
                                                                                                                                                                                                                                                                                                                                                                  New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Duclert A, Dumas Milne Edwards

       x51787 to x52019 represent 5' expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in Y12987 to Y13219, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haemostatic and thrombolytic activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity and chromosome mapping procedures. The sequences can also be used for other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for other activity arcmofer general research and corresponding procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic;
obtaining corresponding promoter sequences.
                                                                                                                                                                                                                                                                              Example 2; Page 15; 577pp; English.
                                                                                                                                                                                                                                                                                                                                       New isolated brain-derived nucleic acids - used to develop which may have cytokine, immune, regulatory, haematopoiesis
                                                                                                                                                                                                                                                                                                                                                                                                                                     Duclert A,
